Team consists of blended expertise in Retail, Banking and ERP industry solutions. Team is having strong professional experience in the Multi National Company more than a decade in solution development to customer support. Promoter has rich experience in product development SDLC to customer support process over a decade in MNC.

Gartner - The Future of Enterprise Application is Mobility

The drive for pervasive access to information on the part of consumers and enterprise employees continues to accelerate, with the near ubiquitous availability of adequate bandwidth and rapid increase of Smartphone and tablet adoption making mobile one of the top priorities on a CIO's priority list. The digital enterprise is increasingly a mobile enterprise. Business users and customers are showing a sharp interest in mobile devices and mobile applications. Cloud computing enticed many business departments and companies to become more agile with their applications, but it still fundamentally did not enable new processes to significantly improve business value. The greater long-term value, and at the same time challenge, is the transition of extending and creating new business applications for mobile platforms. Mobility enables new processes and access not possible with less-nimble or more-stationary computing environments. This improved access to information and knowledge and can fundamentally impact the value achieved from business applications. Looking at the various enterprise processes, such as sales, marketing, customer service, digital commerce, field service, finance, procurement, supply chain, and human capital, it is clear that no software provider in each market has a lead in setting the direction for mobile applications deployed on behalf of the enterprise.

Concepts such as digital marketing efforts, mobile sales, mobile storefronts, field service, and the support of customers via mobile applications will reshape the direction of the CRM application market. Mobile analytics, social applications, employee-centric applications for talent discovery and management, billing, inventory, and HR applications will all move to mobile platforms.
